Product Info.

This technical document should be read in conjunction with the current 360 material data sheet (MSDS), which is available at www.cfpcomposites.com It is also advised that users familiarise themselves with the current regulatory regulations, Health and Safety policies and operating guidelines for the required machinery and tools to be used.

Cost effective alternative to conventional tooling solutions with unique performance capabilities.

Materials are available with thicknesses from 5 mm to 20 mm and come in a sheet size of 1.3m x 0.8m.

360 is lightweight, easy to machine, bond or mechanically fasten enabling fast block-up to produce large net surface areas.

Suitable for high precision direct-to-part tooling, assembly fixtures, jigs or backing structures.

The materials can be used either in or out of autoclave.

Available in volume on 7-day lead-times

Technical Info	Typical Value	Value	Test Method
	Typical Value		
	Colour	Black	Visual
	Hardness, Shore D	84	according to ISO 868: 2003
	Density, g/cm ³	1.290	according to BS EN ISO 1183-1: 2012, Method A
	Flexural Strength MPa	186	according to ISO 178: 2010
	Flexural Modulus GPa	21.0	according to ISO 178: 2010
	Tensile Strength MPa	153	according to BS EN ISO 527-2: 2012
	Compressive Strength MPa	285	according to BS EN ISO 604: 2003
	Compressive Modulus GPa	19.6	according to BS EN ISO 604: 2003
	The full Interek report containing these mean test results is available upon request	Test data from 2019

Blocking Up & Bonding

Prior to Blocking up

Precautions should be taken to ensure all local health and safety guidelines have been met. Personal Protective Equipment (PPE) should consist of a minimum of P3 rated breathing apparatus, safety overalls or disposable overalls, suitable gloves and safety glasses/googles to meet the requirements of the materials/chemicals you will be using.

Each mating surface to be bonded should be abraded using a very coarse sanding paper (i.e. 60 Grit) this is to ensure that the surface is suitably keyed.

Prior to adhesive application, all surfaces to be bonded must be grease and contaminant free.

To clean the surfaces to be bonded, ONLY use Isopropyl alcohol (IPA) and lint free cloths to wipe clean. Take care not to re-contaminate the surfaces prior to bonding.

Using alternative products may cause bonding issues or deformation in the to be bonded surfaces.

Bonding

When selecting an adhesive, it should be taken into consideration the gel time needed to completely cover all areas, ensuring enough time is left to clamp up.

Both surfaces should be wet out with the adhesive and placed loosely in position.

Once all required blocks have been positioned lightly tighten the clamps. Ensuring that equal pressure is applied to all the boards. Overtightening will cause the adhesive to spread unevenly, this may lead to stress build up in the boards and cause micro cracking and/or warping.

Care Notes

If there is a bond gap required, the use of solid microspheres or bond wire can be used. The users own preferred method &/or specification can also be used.

CFP Composites recommend Hysol EA 9394 for bonding.

If you choose to use alternatives, you must conduct your own trials and no responsibility will be accepted by CFP Composites if reactions or failure occur.

It is advised that the adhesive manufactures "air" cure times are met.

Force curing the adhesive is not recommended and may cause the adhesive to flow out of the bond joints.

CFP Composites only recommend using Isopropyl alcohol (IPA) and lint free cloths to wipe clean our 360 product. If you choose to use alternatives, you must conduct your own trials and no responsibility will be accepted by CFP Composites if reactions occur.

Post Curing

Process

It is advised that a post cure process is actioned prior to any surface preparation.

This is to ensure any expansion from the adhesive is removed prior to component manufacture.

It is advised that the final post cure temperature should be 30 degrees centigrade higher than the component to be made from the tool. This is to take into account the air temperature of process oven / autoclave.

Example – a standard epoxy-based carbon fibre pre-preg cure will have a maximum temperature of 135 degrees centigrade. This will mean the post cure maximum temp will be 165 degrees centigrade.

Please make sure the adhesive used can operate at the elevated temperatures of the post cure.

CFP Composites recommends Hysol EA 9394 or equivalent.

Post cure cycle (oven cure)

Ensure there is enough air gap around the tool and thermocouples are attached at thickest parts of the tool.

Ramp rates must not exceed 1.0°C per minute during post cure.

Dwell for 4 hours at the elevated temperature.

Cool a maximum of 2 degrees per min to ambient

If you choose to use alternatives adhesives, you must conduct your own trials and no responsibility will be accepted by CFP Composites if reactions or failure occur.

Surface Preparation	<u>Process</u>	
	After the post cure process the tool can now be surface abraded.	
	Depending on the machining finish it is advised to start by using a 400 grit paper up to the desired surface finish.	
	A 600 grit finish has been shown to more favourable results.

Release	Release	Care Points
	Prior to release ensure the tool surface is free from moisture, grease and other contaminants.	If the tool has been cleaned using a mould cleaner / acetone / IPA in between part manufacturing, the tool will require a fresh 5 coats of Chemlease 2710.
	To clean the surfaces prior to a release, ONLY use Isopropyl alcohol (IPA) and lint free cloths to wipe clean. Take care not to recontaminate the surfaces prior to applying release agents.	If the tool has been abraded / flattened or surface prepper in any way, the tool will require a fresh 5 coats of Chemlease 2710.
	New Tools Apply 5 coats of Chemlease 2710 with a 100% cotton lint free cloth.	Chemlease 2710 has been developed to be used with this 360 tooling material. If alternatives are used this may cause surface finish issues of the component.
	Touch up coats between components	If an alternative release system is to be considered, CFP Composites should be contacted prior to trial to ensure no reactions.
	Apply 2 coats of Chemlease 2710 with a 100% cotton lint free cloth.	CFP Composites only recommend using Isopropyl alcohol (IPA) and lifter free cloths to wipe clean our 360 product. If you choose to use alternatives, you must conduct your own trials and no responsibility will be accepted by CFP Composites if reactions occur.
